

Cafeteria Management System

PROJECT STATEMENT

Problem Statement

Running a small cafe or food counter gets hectic, especially when writing down orders on paper and calculating bills by hand. Doing math manually leads to mistakes, receipts take time to make, and keeping track of customer names and phone numbers in notebooks becomes messy. The shop needs a quick, straightforward way to handle orders and check daily sales without confusion.

Scope of the Project

This project builds a simple command-line software tool to handle daily counter operations for a small cafe.

What's Included

- Showing a clear menu with item numbers and prices.
- Taking customer orders item-by-item and checking quantities.
- Automatically calculating subtotals, adding 5% GST, and printing a final bill.
- Saving customer details (name, phone number, and total bill) during the shift.
- Viewing a list of all customers served in the current session.

What's Not Included

- Saving records permanently to a database (data clears when the program closes).
- A graphical or web-based screen (it runs entirely in the text terminal).
- Tracking kitchen inventory or stock count automatically.
- Accepting online payments or card swipes.

Target Users

- **Counter Staff / Cashiers:** Employees who take customer orders at the desk and print out bills quickly.
- **Cafe Owners:** Managers who want a quick look at who ordered what during the day.

High-Level Features

- **Easy Menu Display:** Shows numbered food and drink options clearly so staff can type in choices fast.
- **Quick Billing and Tax Calculation:** Instantly totals up the order, adds the 5% tax, and shows a clean final receipt.
- **Simple Customer Log:** Asks for the customer's name and phone number to keep an organized list of visitors.
- **Main Menu Dashboard:** A simple text menu that lets staff jump between taking new orders, checking past customers, or closing the app.
